AMENDMENTS TO THE SPECIFICATION

Please amend the title of the application as follows:

FIBER-MADE SURFACE FASTENER REDUCED IN FOR REDUCING UNPLEASANT NOISE AT PEELING-OFF AND ITS ATTACHING PRODUCT PROVIDED THEREWITH

Please amend the paragraph beginning at page 20, line 6, as follows.

Hardness of the base fabric of the surface fastener can be obtained as a force necessary for the bending with a forward bending machine (KES-F2, manufactured by KATO TECH CO., LTD.). The KES-F2 operates as shown in FIG. 4. A fixed chuck 1 and a movable chuck 2 are disposed with a predetermined interval and a sample whose two ends are sandwiched by the fixed chuck 1 and the movable chuck 2 is bent as the movable chuck 2 moves on a trajectory having a specific curvature. That is, the movable chuck 2 moves with its neck swinging so as to maintain the specific curvature (1/r). A minimum curvature of a measurable sample is 4 mm. A moment applied to the fixed chuck 1 when the curvature is 4.0 mm is measured according to such a method and flexibility of the base fabric is evaluated. With a bending angle set to 180°, bending strength of the sample was measured. Data was converted in terms that a width was 25 mm and then, the bending strength per 25 mm was compared.
